

To Whom it may concern

Supply of Energy and Raw Materials

The European Association of Depth Filtration (EFT) notes with concern that there is increasing insecurity concerning the supply of energy and raw materials required for the production of Depth Filters. This is especially the case for gas used in the drying process of filter sheets, electricity, and key ingredients such as cellulose pulps, minerals, and wet strength agents.

The EFT would like to emphasize that Depth Filters are a necessary element in the production process of essential industries such as beverage, food, and pharmaceuticals. The EFT is ready to interact with suppliers and political authorities to make sure that the production of depth filters receives the necessary priority for the supply of energy and key raw materials. The goal of all EFT members is to ensure a continuing and stable supply chain of depth filters to the market.
